Status API

API Routine: APINSTAT

Parameters: UGNLPARM, UAPLSTAT

The Status API allows users to add, modify or display (retrieve) information about a particular status. The following functions are valid:

A   Add status.

D   Display status (Retrieve).

M   Modify an existing status.

This chapter covers the following topics:

- Local Data Area UAPLSTAT

- Status API Return Codes

Local Data Area UAPLSTAT

The fields to be passed to the API as the second parameter are in the supplied local data area UAPLSTAT. The following is a detailed description of these fields:
